PÉTROLE VIKINGS, UNE SENTINELLE SUR CHENILLES

» PHILIPPE PASSEBON
ppassebon@industrie-technologies.com

Total a lancé en 2013 avec l'Agence nationale de la recherche un concours entre cinq équipes pour mettre au point un robot de surface autonome adapté aux environnements du pétrole et du gaz et conforme aux normes sur les atmosphères explosives. Avant la dernière épreuve en mars 2017, le robot Vikings, conçu par la PME Sominex et le laboratoire de recherche de l'école d'ingénieurs Esigelec, est en tête.

LE SENS DE L'ORIENTATION

À l'avant, un lidar mononappe (doté d'un seul faisceau) détecte les obstacles. À l'arrière un lidar 16 nappes mesure la position du robot, par comparaison avec une carte pré-enregistrée. Les données obtenues sont fusionnées avec celles de la centrale inertielle et la mesure de la distance parcourue par les chenilles.

Batterie amovible
(3 heures d'autonomie)

LA PEAU

Pour éviter une explosion induite par le dégagement de chaleur des composants internes, le robot est étanche, et revêtu d'une enveloppe en aluminium AU4G anti-déflagrante, qui doit contenir l'explosion interne. La base du robot est équipée d'un détecteur de gaz.
